

Underfloor Heating Guide

All our sisal ranges of natural floor coverings can be fitted in conjunction with underfloor heating but we do not recommend using any of our coir or seagrass ranges. All our wool floor coverings work well, unless otherwise stated.

Our new range of fauXsal™, an innovative synthetic sisal look floorcovering, works particularly well as it is a man-made fibre and has a low tog rating. When fitting any of these ranges in conjunction with underfloor heating there are a number of procedures that need to be adhered to:

All floor coverings need to be acclimatised in situ for at least 48 hours. During this time the underfloor heating must be left on at room temperature, i.e. a comfortable ambient temperature of about 20°C.

It is essential that the underlay used is appropriate for underfloor heating. We recommend Ball & Young ranges, either Roma or Venice or where the flooring is to be double stuck either Radiance or Olympic.

If double sticking we only recommend adhesives by F Ball: Styccobond F3 for permanent bond (floor covering to underlay) and Styccobond F40 (securing the underlay to the subfloor) as these products have been tested and deemed suitable for use with underfloor heating.
